

Architecture & Systems Engineering

Week 4: Modeling with DSMs and Modularization

Project Portfolio

Name

Tomas Mawyin

Instructions

Before you begin, you should save your Project Portfolio on your local drive. We recommend the following format:

Lastname_Firstname_Course1_Week4

Please note: You will not be able to re-download your file after submission; therefore, please keep this file in a central location for future reference.

While you will begin working in groups again this week, the project deliverable is an **individual submission**. A scoring rubric can also be downloaded from the course in the Resources/Downloads on the top Navigation.

Like last week, in Week 4 you will be self-assessing your work as well as the work of three peers in the class. If you have any questions, feel free to start a thread in the Discussion Forum. Although work is strictly individual, sharing ideas and concepts with other students is encouraged.

Note: edX has a 10MB file size limit for document submission. If you have selected large image(s), you may need to resize before submitting, OR you may simply include a web URL for the image in the image location. Be sure to submit your assignment at least one hour before the deadline to provide time for troubleshooting.

Once the deadline passes, you will not be able to upload the document and therefore will not be able to submit and complete the assignment.

Peer assessment is limited to 300 characters.

Week 4 Project

Overview

In the fourth project activity of this course, you will continue to build on the system your team selected during Week 3. We will further study the system by decomposing it and reviewing its change propagation properties. The steps on the right will guide you through this process.

Note that some Scratch Pages are included at the end of this document for you to capture any ideas, sketches, etc. you have as you work through the project. These will not be assessed and you are not required to submit them with your project (but you may do so if you think they offer any additional insight into your thinking process!).

REQUIRED STEPS:

Step 1: Decompose the system.

Step 2: Analyze the system DSM.

Step 3: Identify the change propagation.

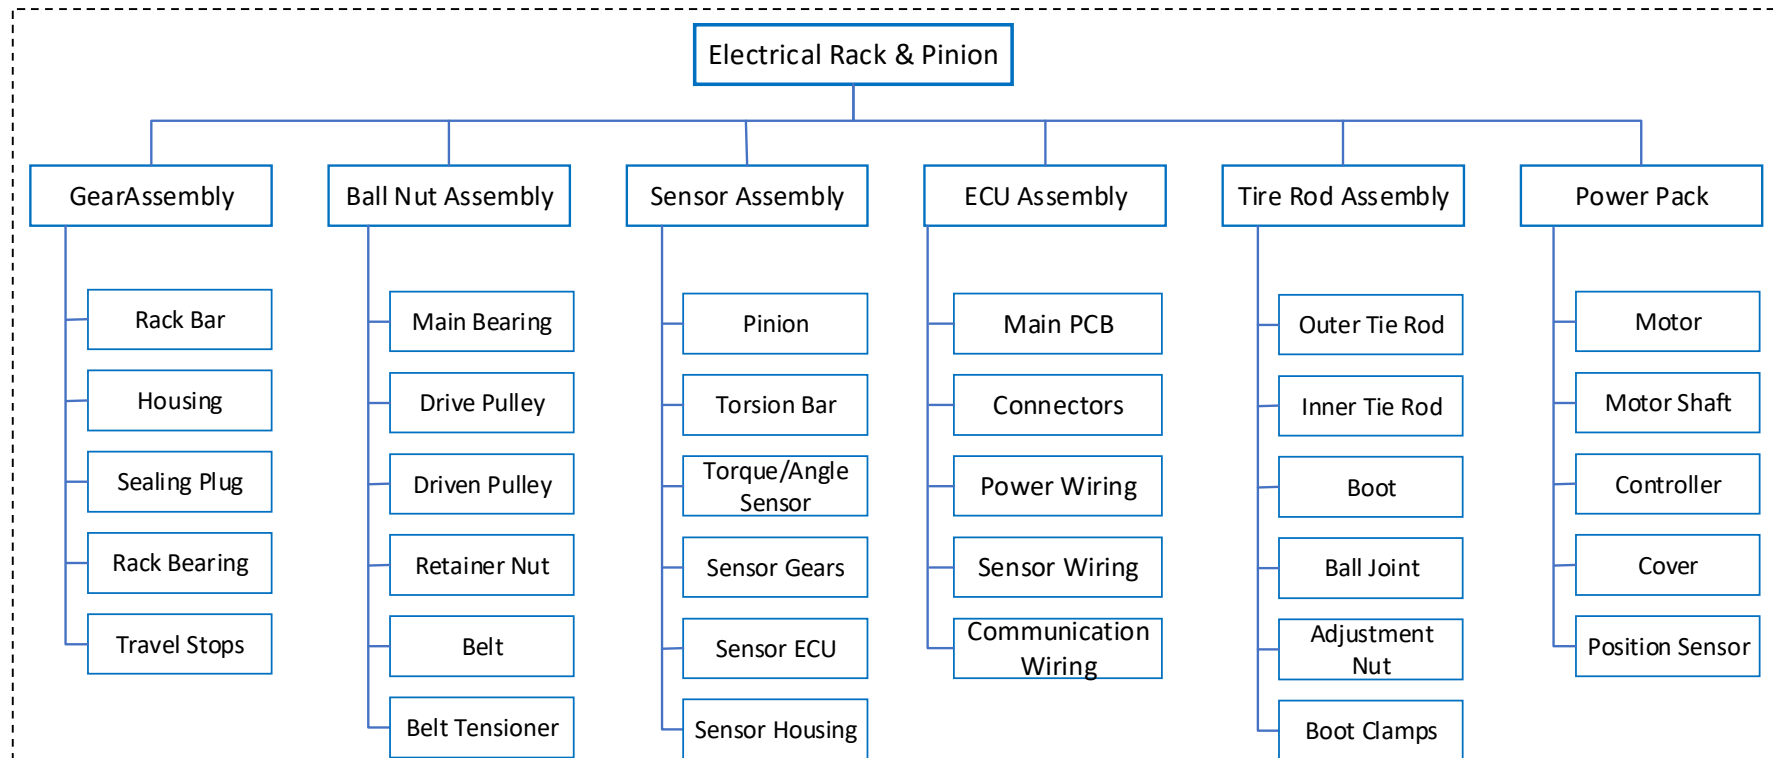

Step 4: Review and submit your project.

STEP 1: DECOMPOSE THE SYSTEM

For your system chosen in Week 3, develop a system decomposition. The system decomposition should be (1) of form (objects), (2) a two-level down decomposition with 7 ± 2 components per level and (3) shown as a tree structure or an indented list. Please remember the file size limit and resize or paste the image URL instead, as needed.

Name of System: Electronic Rack & Pinion Steering System

System Decomposition:

STEP 2A: SYSTEM DSM

Based on your Level Two system decomposition from Step 1, develop a $N \times N$ Design Structure Matrix. Clearly label each row and column. Attempt to arrange objects in the order of decomposition. This will allow you to match Level One modules in the DSM. Please remember the file size limit and resize or paste the image URL instead, as needed.

System DSM

key		Sort	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z	AA	AB	AC	AD	AE	AF	AG	
1	Rack Bar	Box	A			x	x	x						x												x										
2	Housing	Box	B			x	x	x	x		x	x						x	x	x		x	x	x		x				x						
3	Sealing Plug	Dash	C				x																													
4	Rack Bearing		D	x	x	x																														
5	Travel Stop		E	x	x																				x											
6	Main Bearing		F	x	x						x	x																								
7	Drive Pulley		G	x									x																				x			
8	Driven Pulley		H							x			x	x																						
9	Retainer Nut		I	x							x																									
10	Belt		J							x	x																									
11	Belt Tensioner		K	x									x																							
12	Pinion		L	x												x	x	x	x	x																
13	Torsion Bar		M													x		x																		
14	T/A Sensor		N													x	x		x	x	x															
15	Sensor Gears		O													x		x		x	x															
16	Sensor ECU		P	x												x	x	x		x	x	x	x	x	x											
17	Sensor Housing		Q	x												x	x	x	x																	
18	Main PCB		R	x																x													x	x	x	
19	Connectors		S																	x	x													x	x	
20	Power Wiring		T	x																x	x	x												x	x	
21	Sensor Wiring		U	x																x	x	x												x	x	
22	Comm Wiring		V	x																x	x	x												x	x	
23	Outer Tie Rod		W																																	
24	Inner Tie Rod		X	x				x																		x										
25	Boot		Y		x																															
26	Ball Joint		Z																																	
27	Adjust Nut		AA																																	
28	Boot Clamp		AB																																	
29	Motor		AC	x																x	x	x												x	x	
30	Motor Shaft		AD									x																						x	x	
31	Controller		AE																																x	
32	Cover		AF	x																															x	
33	Position Sensor		AG																																x	

Given the DSM developed in the previous step, attempt to cluster or partition one level up in order to expose modules of the system. Are the modules identical or different than your form decomposition from Step 1? What insights can you gain as an architect from a DSM? Please use the DSM Excel file provided in this module.

Please remember the file size limit and resize or paste the image URL instead, as needed.

[illegible]

It is also possible to have smaller clusters to match the decomposition on Step 1 but these clustering simplifies the system interactions

STEP 3: CHANGE PROPAGATION

Given the DSM developed in Step 2A, identify a sorted list of Level Two objects (top five) which would create a large change propagation impact. In essence, what are the top components which would represent the largest change propagation chains in the system? List the components and identify up to three of the longest chains of propagation among the components. When thinking about change propagation, it is useful to remember that changes often exceed two generations, but rarely exceed five. Parts of a system being interconnected does not necessarily lead to endless change propagation, and in real world projects propagation depends on a lot of contextual factors.

Change propagating components:

Component description	Number of Interfaces of the component	Change chain propagation [c1-c2-cX], [c1-c4-cX]
Housing	15	Changing in the housing affects how a lot of the components are positioned. For instance, it changes the main bearing which in turn changes the position of the rack and the driven pulley causing the motor to move
Main PCB	10	PCB changes affects communication and control. Affects the motor which in turn affects the motor shaft. The motor shaft affects the drive pulley.
Sensor ECU	10	Changes in the Sensor ECU affect the torque/angle sensors required which in turn can affect the wiring sizing of the system
Motor	7	Changes in the Motor can affect the controller. In turn this can affect the connector types which in turn affect the wiring sizing of the system.
Pinion	6	Changing anything on the Pinion affects the rack (position/geometry) which in turn changes the entire Ball Nut Assembly geometry and location

STEP 4: REVIEW & SUBMIT PROJECT

- Submit your completed Week 4 Project Portfolio file.
- Complete Self-Assessment of Project
- Complete Peer Assessments of Project (Peer assessment is limited to 300 characters)

Note: The maximum file size that can be submitted is 10MB.

- A sample project submission and scoring rubric can be downloaded from the course in the Resources/Downloads tab on the top navigation.
- Please remember that there are three steps to this assignment: Submission, peer assessment, and self assessment. Please provide enough time by each deadline to complete your assignment on time, as it is not possible to submit once the submission window closes.
